

“One common product across different industries ranging from liquids to electronics”

## 4S VisiLog – Manage your supply Chain

**4S VisiLog** is a world class SCE engine, empowering the supply chains of today's enterprises. It is ideally suited for the demanding needs of dedicated distribution and trading businesses with a requirement for supply chain support as part of their business process and links various parts of the supply chain by providing a real time web-centric application built on J2EE web technology.

**4S VisiLog SCE information architecture has been designed to optimise, synchronise and integrate supply chain resources, processes and relationships.**

**4S VisiLog** is based on Supply Chain Operations Reference (SCOR), a cross industry standard model for supply chain management. It solves real-world issues by seamlessly integrating the relationships, resources and processes in a supply chain. The solution provides a single repository to capture all the information pertaining to transactions, relationships and processes. This repository gets its information from the thousands of messages that flow through the operation.

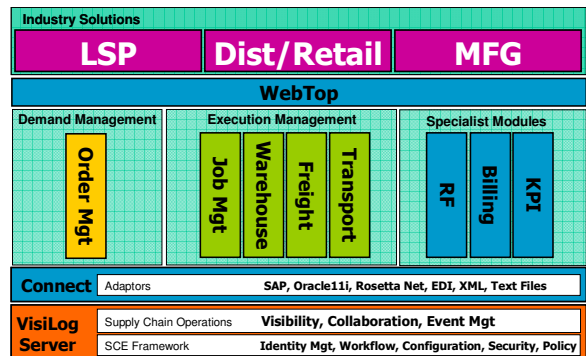

**4S VisiLog** provides the foundation to achieve total supply chain visibility within a short time frame. Data can enter the framework from older non-integrated applications as well as current applications. It also allows the migration to a Service Oriented Architecture.

### Your Benefits

- Total supply chain visibility from order to cash
- Improved operational efficiency
  - ✓ Orders processed and shipments managed globally
  - ✓ Information and financial flow for all parties
  - ✓ Support for multiple operational centres
- Inventory accuracy
- Asset protection
- Financial accountability
- Corporate governance
- Collaborative platform

### Key Features

- Order management
- Warehouse management
- Inventory management
- Transport management
- Freight management
- Integrated accounts
- Customer service
- VRM
- CRM
- Trace & Trace
- Reports & KPIs

### Technology Highlights

- Interactive third-party interface with all the partners in the supply chain (vendors, customers and transport service providers)
- Flexible to support future changes
- Scalable to grow with the business
- Modern J2EE platform to support future demands
- Independent of platform and support for multiple databases
- Full functionality with minimal technical complexity
